Population Changes: Natural Growth, Overall Growth, 1950-2050

*Prospective Age not available yet
**Estonia**

### Population by Age Groups, 1950-2050

![Bar chart showing population by age groups from 1950 to 2050, with a significant increase in the elderly population (65+) over time.]

### Demographic Dependency Ratios*, 1950-2050

![Graph showing demographic dependency ratios from 1950 to 2050, with lines representing total demographic dependency ratio, young age dependency ratio, and old age dependency ratio.]

### Ageing of the Aged, 1950-2050

![Bar chart showing share of the very old (80+) in the total elder population (65+) from 1950 to 2050.]

### Living Arrangements by Age Groups*, 2001

![Bar chart showing living arrangements by age groups for 2001, with categories for women and men in single and institutional households.]

### Life Expectancy at Certain Ages, 2002

![Bar chart showing life expectancy at different ages, from birth to 80 years, for women and men.]

### Survival Rates, 1995-2005

![Graph showing survival rates from 1955 to 2005, with specific rates for ages 20, 60, and 80 for both women and men.]

**Sources:**
- Living Arrangements: Eurostat: Census 2001, National level
- Life Expectancy: Eurostat 2006

**Notes:**
- YADR = 0-14/15-64
- OADR = 65+/15-64
- TDDR = (0-14) + (65+)/15-64

*For the age-group 0-14, the figures are always below 0.05%

*Life expectancy is a measure of mortality in the given calendar year*

Projections:
All references to the World Population Prospects pertain to the projection variant medium. For the period 1950-2005, population estimates are used from the same source.

DEM01c
Median Age:
The median age of a population is that age that divides a population into two groups of the same size, such that half of the population is younger than this age, and the other half older (UN World Population Prospects)

DEM01d
Prospective Age (still to be processed):
The median age of a population standardized for expected remaining years of life.

DEM01e
- Population Growth Rate = Average annual rate of population change (per cent) = Average exponential rate of growth of the population over a given period. It is calculated as ln(Pt/P0)/t where it is the length of the period. It is expressed as a percentage
- Rate of Natural Increase = Crude birth rate minus the crude death rate. Represents the portion of population growth (or decline) determined exclusively by births and deaths
- Difference = (Population Growth Rate - Rate of Natural Increase) = Net Migration Rate

DEM01g
- Young age dependency ratio (YADR) = ratio of population aged 0-14 per hundred population 15-64
- Old age dependency ratio (OADR) = ratio of population aged 65+ per hundred population 15-64
- Total dependency ratio (TDR) = ratio of population aged 0-14 and 65+ per hundred population 15-64

DEM01h
Ageing of the Aged:
measured by the share of the very old (80+) in the total elder population (65+)

DEM01i
Living Arrangements:
(i) % of the population living in single households
(ii) % of the population living in institutional households
Important to mention: whether institutional population is distinguished or not.
**DEM02a**  
**Life Expectancy at Certain Ages:**  
The mean number of years still to be lived by a person who has reached a certain exact age, if subjected throughout the rest of his or her life to the current mortality conditions (age-specific probabilities of dying)  
(definition Eurostat)

**DEM02b**  
**Survival Rates:**  
The survival rate to a specific age X is the proportion of newborns in a given year who would be expected to survive at age X if current mortality trends were to continue for at least the next X years.  
Survival rates are derived from the life table, which is an analytic procedure designed to produce estimates of life expectancies and other measures of mortality, based on prevailing age-specific death rates. (UN-DESA definition)

**DEM02c**  
**Pension Duration:**  
Estimated by the difference between effective retirement age, or effective labour market exit retirement age (see Part on Labour Market Indicators), and life expectancy at this age.

**DEM03a**  
**Total Fertility Rate of a population (TFR):**  
The average number of children that would be born to a woman over her lifetime if she were to experience the current age-specific fertility rates through her lifetime. It is obtained by summing the age-specific rates for a given time-point.

**DEM03b**  
**Net Reproduction Rate (NRR):**  
The average number of daughters a hypothetical cohort of women would have at the end of their reproductive period if they were subject during their whole lives to the fertility rates and the mortality rates of a given period.  
It is expressed as number of daughters per woman (Hypothetical number of surviving daughters per woman)

**DEM05a**  
**Health Indicators**  
- **Life Expectancy (LE):**  
The average number of years of life expected by a hypothetical cohort of individuals who would be subject during all their lives to the mortality rates of a given period. It is expressed as years. (UN definition)

**World Health Organization (W.H.O.):**  
Healthy life expectancy (HALE) at birth adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states  
- **Healthy Life Expectancy (HALE):**  
Average number of years that a person can expect to live in „full health“ by taking into account years lived in less than full health due to disease and/or injury. (W.H.O. Definition.  
For more details, see: [http://www.who.int/healthinfo/statistics/indhale/en](http://www.who.int/healthinfo/statistics/indhale/en)  
This indicator measures the equivalent number of years in full health that a newborn child can expect to live, based on the current mortality rates and prevalence distribution of health states in the population.
- **Life Expectancy (LE):**  
The average number of years of life expected by a hypothetical cohort of individuals who would be subject during all their lives to the mortality rates of a given period. It is expressed as years. (UN definition)
